MANPOWER REQUIREMENTS DERIVATION
FOR THE NAVY COMPREHENSIVE COMPENSATION AND SUPPLY STUDY

Rating-specific manpower requirements are included in the NACCS optimization model as key constraints. The statement of manpower requirements used is basically that expressed in the U.S. Navy Enlisted Objective Force, (Op-120C: NMPC-1643, dated 15 April 1981). However, for application in NACCS, it was necessary to decompose the objective force into various subsets of requirements. This memorandum describes the procedures followed to create the NACCS requirements.

The objective force is a statement of Navy total active enlisted manpower requirements by rating, paygrade, and length of service (LOS). Since the current version of NACCS addresses only USN 4YO non-prior service (NPS) males, manpower requirements in all other categories must be deleted from the objective force. Also, in that NACCS treats general detail (GENDET) personnel as a separate group, GENDET requirements must be factored out to arrive at true rating requirements in the objective force. We will discuss the rating requirements methodology and 4YO requirements in order. The computer program used to determine NACCS requirements is included as appendix A. Appendix B is a sample of the program output.

RATING REQUIREMENTS

The U.S. Navy Enlisted Objective Force includes requirements for GENDETs, but they are not explicitly stated in terms of a rating. Rather, they have been allocated to general and service ratings based on historical patterns of GENDET behavior in attaining rating designations. By removing these non-rated, non-designated requirements from the objective force, we create rating-specific requirements. The residual becomes GENDET requirements which we use as constraints for a separate GENDET "rating."

The algorithm used to allocate GENDETs to ratings before the creation of the objective force is implemented in a program called LOBAL (see appendix C for the Op-135D1/NMPC-1643 writeup). Because we are simply reversing this allocation, an understanding of what steps LOBAL performs is important. The steps listed below allocate the apprenticeship groups to given ratings, spread those individuals over LOS cells (consistent with the actual totals in each LOS cell), and generate rating totals (designated plus undesignated) as input for developing the Objective Force. HMs and DTs, along with their apprenticeship groups, are input directly and will not be discussed here. For expository purposes, we have divided the process into six steps.

1. By convention, many individuals are assigned to the Seamen apprenticeship group until they find out what ratings they want to enter or will be allowed to enter. Therefore, examination of the inventories of the four apprenticeship groups (Seamen, Airmen, Firemen, Constructionmen) at any given time shows more SNs than expected based on rating requirements. The first step in LOBAL is to allocate some of these SNs to the other apprenticeship groups based on what has historically occurred during their progress toward being designated in a rating.

2. Some individuals listed in the apprenticeship groups are actually in formal school training for a rating. They are added to the striker population in the appropriate rating, and subtracted out of the apprenticeship pool.

3. If the total allocated at this point is not sufficient to meet minimum striker requirements for a given rating, an extra allocation is made. Also, at this point it is possible to intervene in the process to make some additional allocations based on information not contained in the model. (We were told this occurred for about 15 ratings in FY 1981.*)

4. The remaining individuals in each apprenticeship group are allocated to ratings for which they normally strike based on historical

* Conversation with CDR James Smith of NMPC-16.

data from E-4 advancement examinations (factors supplied by DPRDC). For example, the proportion of individuals taking the test for rating Y who are from apprentice group X becomes a factor for allocating additional unrated, undesignated Xs to rating Y.

5. The population of unrated, undesignated individuals that has been apportioned to each rating is then allocated across LOS cells within the rating, subject to the condition that the number of unrated, undesignated individuals allocated to any given LOS cell across all ratings matches the actual inventory for the apprenticeship group.

6. Finally, these rating-LOS totals (designated plus undesignated) are used as the input to the FAST model. FAST output is then used in goal development models that produce the Objective Force.

Our purpose here is to determine how many GENDETs have been allocated into a given LOS cell for a given rating, and subtract out that number to arrive at rating requirements. This procedure is relatively simple, given the output from the LOBAL program supplied to us by NMPC.

The first five steps above are performed within the LOBAL program. However, the results need two corrections. The first is a rounding correction, necessitated by performing calculations that result in numbers of "people" that are not integers. This rounding process occurs in steps four and five. The second correction involves taking into

account the increase or decrease needed in the LOBAL base inventory to size the objective force. For example, if a given LOS in a given rating has 90 designated individuals and is allocated 10 unrated, undesignated individuals by LOBAL, the total number passed to FAST is 100. If the resultant objective force figure is 110, we assume it is made up of 99 designated and 11 undesignated individuals based on the same proportions applied in LOBAL.

After performing these calculations, we are left with a set of rating-specific objective force requirements, as well as GENDET requirements. The next step is to estimate true 4YO requirements.

4YO REQUIREMENTS

The requirements derived above include manpower sources other than USN, 4YO, NPS males. Since there is no program analogous to LOBAL that would permit us to directly factor out the 4YOs, we had to scale down the requirements using historical data.

From the June 1980 EMR (used by NMPC to create the LOBAL base), we determined rating, LOS cell (through year 5), and length of obligation for the enlisted inventory. Women and prior service personnel were included by rating and LOS only. The basic procedure employed a combination of checks utilizing type of accession program, term and number of enlistments, rate code, EAOS, and extension data to estimate each

individual's obligation. The rating allocation of women, prior service, and USNR was quite straightforward. However, the allocation of 4, 5, and 6 year obligors was complicated by 'A' school attendance. Short of creating a separate cohort file, we made the following simplifying assumptions:

1. Non-rated individuals, regardless of LOS, retain their original obligations. For example, a Seaman in LOS 3 who entered as a Nuclear Field 6YO is assumed to remain a 6YO. In practice, had this individual been an academic failure from 'A' school, the obligation would likely have been reduced. On the other hand, if he were a disciplinary drop from 'A' school, or someone whose rating designation was removed for cause, the original obligation would probably remain.

2. Individuals in ratings with mixed 4 and 5 or 6 year obligations, who entered as 4YOs but incurred a 12 or 24 month school extension, are categorized as 5 or 6YOs, respectively. Thus, for example, an individual who entered through the S/A/F Program (4YO GENDET), but appears in LOS 2 as a designated ET striker with a 24 month school extension, is classified as a 6YO.

The latter assumption should give a reasonable estimate of the true 4YO population by rating. However, the first assumption probably underestimates true 4YO GENDETs, since a significant number of 'A' school drops are academic failures whose obligations would be reduced (in the

case of 5 and 6 YOs). We intend to perform sensitivity analyses to determine how increases in the proportion of 4YO GENDETs affect overall results.

The above computations gave us USN, 4YO, NPS males as a percent of the total inventory by rating for LOS 1-4 and LOS 5. We then directly applied these percentages to the rating requirements derived earlier and arrived at our estimate of 4YO requirements for LOS 1-4 and LOS 5.

In the aggregate, we estimate that 54 percent of LOS 1-4 requirements and 40 percent of LOS 5 requirements must be met by USN, 4YO, NPS males.

APPENDIX C
LOBAL METHODOLOGY

LOBAL

LOBAL reads the inventories for the apprenticeship groups AN, CN, FI, and SN. These are stored in an array which is dimensioned by apprenticeship, pay grade, and LOS. It then adjusts for laterals by taking those E1 Seamen in LOS cell 1 and distributing them to AN, CN, FI, and SN based on the distribution of the total 53 apprentices by apprenticeship. The inventories for the HM and DT apprenticeships are read directly into FAST and are not distributed as the other apprenticeships are.

The "unseen strikers" (A school students) are added in with the appropriate striker population and deducted from the non-designated population. When the combined number of strikers and unseen strikers in any rating is less than the striker requirement, non-designated personnel are allocated to that rating in order to bring all ratings up to the level of the striker requirements. The remaining non-designated personnel are allocated to ratings through the use of "beta factors."

After all of the non-designated personnel have been allocated to ratings, LOSAL distributes to LOS cells the number in each rating by using a weighted average of the LOS distribution of designated strikers and the LOS distribution of the appropriate apprenticeship. For each LOS, it then sums across ratings; this sum must equal the number in that same LOS of the appropriate apprenticeship group. Once the non-designated inventories have been allocated to ratings and LOS, LOBAL then rounds the numbers. The inventories are then sent to FAST and LORATE.

LOBAL

- INPUTS: 1. ACTUAL END YEAR INVENTORY FROM TAFMS VIA FASTINV PROGRAM.
2. BEGIN YEAR SCHOOL SITTERS FROM PROGRAM AUTO A.
3. B3 DESIGNATED REQUIREMENTS FOR YEAR ONE FROM EPA.
4. BETA FACTORS AS COMPUTED BY NPRDC, SAN DIEGO.
